Abstract:

This study presents a systematic review of literature from key databases including CAB Abstract, Cochrane Library, Cumulative Index to Nursing and Allied Health (CINAHL), EMBASE, HTSAT, OCLC, MEDLINE, and CSA to develop a meta-analysis research question in the areas of AIDS and cancer research. The methodology employed for research question development is outlined, along with the finalized research question(s) and their implications for advancing knowledge in these critical health domains.

Keywords:

AIDS, Cancer Research, CAB Abstract, Cochrane Library, Cumulative Index to Nursing and Allied Health (CINAHL), EMBASE, HTSAT, OCLC, MEDLINE, CSA

Introduction:

Meta-analysis plays a crucial role in synthesizing research findings across studies in the fields of AIDS and cancer research. This introduction provides context for the importance of developing a research question through a systematic review of literature from various databases.

Methodology for Research Question Development:

The methodology section details the systematic approach employed to identify relevant studies from CAB Abstract, Cochrane Library, Cumulative Index to Nursing and Allied Health (CINAHL), EMBASE, HTSAT, OCLC, MEDLINE, and CSA. Criteria for study selection and strategies for identifying variables and moderators are elucidated.

Results:

The results section presents the finalized research question(s) developed through the comprehensive review of literature from key databases. Rationale and justification for the selected research question(s) are provided, along with a discussion of challenges encountered during the development process.

Discussion:

Interpretation of the significance of the research question(s) in addressing gaps or controversies in AIDS and cancer research is discussed. Implications for future meta-analytic research and practice are considered, highlighting the contributions of the developed research question(s) to advancing knowledge in the field.

Conclusion:

Summarizing the key findings and conclusions of the study, this section emphasizes the importance of developing a well-defined research question for conducting meta-analysis in AIDS and cancer research. Suggestions for further research avenues are offered.

Acknowledgments:

The authors acknowledge the support provided by [Institution/Organization] in conducting this study.
