

~~The utilization of advanced machine learning methodologies facilitated the derivation of statistically significant correlations between multimodal clinical parameters and prognostic outcomes, thereby elucidating potential translational implications~~

This study used machine learning methods to identify meaningful relationships between clinical data and patient outcomes. These results may help support better clinical decision-making in the future

Comments :

The content is scientifically accurate but uses dense terminology and long sentence structure, which obscures the main action and outcome.

Comments :

The revision preserves the original scientific meaning while clearly stating the main actions and outcomes in simpler, more accessible language.
